

# Maxwell's Thermodynamic Relation

Maxwell derived the relation by combining 1<sup>st</sup> & 2<sup>nd</sup> law of thermodynamics for a PVT system undergoing an infinitesimal reversible process.

We have from 1<sup>st</sup> law of thermodynamics,

$$\begin{aligned}dQ &= dU + dW \\ \Rightarrow dQ &= dU + pdV \\ \therefore dU &= dQ - pdV\end{aligned}\quad \text{----- (i)}$$

From second law of thermodynamics,

$$\begin{aligned}dS &= \frac{dQ}{T} \\ \Rightarrow dQ &= TdS \\ \therefore dU &= TdS - pdV\end{aligned}\quad \text{----- (ii)}$$

Considering U, S & V are *function* of two independent variables  $x$  &  $y$ .

$$dU = \left(\frac{\partial U}{\partial x}\right)_y dx + \left(\frac{\partial U}{\partial y}\right)_x dy$$

$$dS = \left(\frac{\partial S}{\partial x}\right)_y dx + \left(\frac{\partial S}{\partial y}\right)_x dy$$

$$dV = \left(\frac{\partial V}{\partial x}\right)_y dx + \left(\frac{\partial V}{\partial y}\right)_x dy$$

Substituting their value in eq. (ii) we have-

$$\begin{aligned}\left(\frac{\partial U}{\partial x}\right)_y dx + \left(\frac{\partial U}{\partial y}\right)_x dy &= T \left\{ \left(\frac{\partial S}{\partial x}\right)_y dx + \left(\frac{\partial S}{\partial y}\right)_x dy \right\} - p \left\{ \left(\frac{\partial V}{\partial x}\right)_y dx + \left(\frac{\partial V}{\partial y}\right)_x dy \right\} \\ &= \left\{ T \left(\frac{\partial S}{\partial x}\right)_y - P \left(\frac{\partial V}{\partial x}\right)_y \right\} dx + \left\{ T \left(\frac{\partial S}{\partial y}\right)_y - P \left(\frac{\partial V}{\partial y}\right)_x \right\} dy \quad \text{---(iii)}\end{aligned}$$

Comparing the coefficient of  $dx$  &  $dy$  from equation (iii) we have-

$$\left(\frac{\partial U}{\partial x}\right)_y = T \left(\frac{\partial S}{\partial x}\right)_y - P \left(\frac{\partial V}{\partial x}\right)_y \quad \text{----- (iv)}$$

$$\left(\frac{\partial U}{\partial y}\right)_x = T \left(\frac{\partial S}{\partial y}\right)_x - P \left(\frac{\partial V}{\partial y}\right)_x \quad \text{----- (v)}$$

Differentiating equation (iv) & (v) with respect to  $y$  &  $x$  we have-

$$\frac{\partial^2 U}{\partial y \cdot \partial x} = \left(\frac{\partial T}{\partial y}\right)_x \cdot \left(\frac{\partial S}{\partial x}\right)_y + T \cdot \frac{\partial^2 S}{\partial y \cdot \partial x} - \left(\frac{\partial p}{\partial y}\right)_x \cdot \left(\frac{\partial U}{\partial x}\right)_x - p \left(\frac{\partial^2 V}{\partial y \cdot \partial x}\right)$$

$$\frac{\partial^2 U}{\partial x \cdot \partial y} = \left(\frac{\partial T}{\partial x}\right)_y \cdot \left(\frac{\partial S}{\partial y}\right)_x + T \frac{\partial^2 S}{\partial x \cdot \partial y} - \left(\frac{\partial p}{\partial x}\right)_y \cdot \left(\frac{\partial U}{\partial y}\right)_x - p \left(\frac{\partial^2 V}{\partial y \cdot \partial x}\right)$$

Since  $dU$  is a perfect differential, above two expressions are equal  $\frac{\partial^2 U}{\partial y \cdot \partial x} = \frac{\partial^2 U}{\partial x \cdot \partial y}$  and single  $dS$  &  $dV$  are perfect differential.

After simplifying we can write,

$$\left(\frac{\partial T}{\partial y}\right)_x \cdot \left(\frac{\partial S}{\partial x}\right)_y - \left(\frac{\partial p}{\partial y}\right)_x \cdot \left(\frac{\partial U}{\partial x}\right)_x = \left(\frac{\partial T}{\partial x}\right)_y \cdot \left(\frac{\partial S}{\partial y}\right)_x - \left(\frac{\partial p}{\partial x}\right)_y \cdot \left(\frac{\partial U}{\partial y}\right)_x \quad \text{----- (vi)}$$

Equation (vi) is the general equation for Maxwell's thermodynamic Relation.

### 1<sup>st</sup> Relation:

Putting  $x = T$ ,  $y = V$  and taking  $T$  &  $V$  as independent variables.

$$\frac{\partial T}{\partial x} = 1, \quad \frac{\partial V}{\partial y} = 1, \quad \frac{\partial T}{\partial y} = 0, \quad \frac{\partial V}{\partial x} = 0$$

$$\text{(vi)} \Rightarrow \left(\frac{\partial S}{\partial V}\right)_T = \left(\frac{\partial P}{\partial T}\right)_V \quad \left[ \text{But, } dS = \frac{dQ}{T} \right]$$

$$\therefore \left(\frac{\partial Q}{\partial V}\right)_T = \left(\frac{\partial P}{\partial T}\right)_V$$

For a thermodynamic system, the increase of entropy per unit increase of volume at constant temperature is equal to the increase of temperature in a isochoric process.

### 2<sup>nd</sup> Relation:

Taking  $T$  &  $P$  are independent variables. i.e.  $x=T$  &  $y=P$

We get from (vi)

$$\frac{\partial T}{\partial x} = 1, \quad \frac{\partial P}{\partial y} = 1 \quad \& \quad \frac{\partial T}{\partial y} = 0, \quad \frac{\partial P}{\partial x} = 0$$

$$\left(\frac{\partial S}{\partial p}\right)_T = -\left(\frac{\partial V}{\partial T}\right)_p$$

$$\left(\frac{\partial Q}{\partial p}\right)_T = -\left(\frac{\partial V}{\partial T}\right)_p$$

The decrease of entropy per unit increase of pressure in a isothermal process is equal to the increase of volume per unit increase of temperature for a isobaric process.

### 3<sup>rd</sup> Relation:

Taking entropy & volume as independent variables. i.e.  $x=S$  &  $y=V$

We get,

$$\frac{\partial S}{\partial x} = 1, \frac{\partial V}{\partial y} = 1 \text{ \& \ } \frac{\partial S}{\partial y} = 0, \frac{\partial V}{\partial x} = 0$$

From equation (vi) we can write,

$$\left(\frac{\partial T}{\partial x}\right)_S = -\left(\frac{\partial P}{\partial S}\right)_V$$

$$\Rightarrow \left(\frac{\partial T}{\partial x}\right)_S = -T \left(\frac{\partial P}{\partial Q}\right)_V$$

The increase of temperature per unit increase of volume in a reversible adiabatic process is equal to the decrease of pressure per unit increase of entropy in a isochoric process.

### 4<sup>th</sup> Relation:

Taking entropy & Pressure as independent variable. i.e.  $x=S$  &  $y=P$

We have,

$$\frac{\partial S}{\partial x} = 1, \frac{\partial P}{\partial y} = 1 \text{ \& \ } \frac{\partial S}{\partial y} = 0, \frac{\partial P}{\partial x} = 0$$

$$(vi) \Rightarrow \left(\frac{\partial T}{\partial p}\right)_S = \left(\frac{\partial v}{\partial S}\right)_P$$

$$\Rightarrow \left(\frac{\partial T}{\partial p}\right)_S = T \left(\frac{\partial v}{\partial Q}\right)_P$$

The increase of temperature per unit increase pressure in a reversible adiabatic process is equal to the increase of volume per unit increase of entropy in a isobaric process.

### 5<sup>th</sup> Relation:

Taking p & v as independent variable. i.e. x=p & y=v

We get,

$$\frac{\partial p}{\partial x} = 1, \frac{\partial v}{\partial y} = 1 \text{ \& } \frac{\partial p}{\partial y} = 0, \frac{\partial v}{\partial x} = 0$$

$$(vi) \Rightarrow \left(\frac{\partial T}{\partial p}\right)_v \cdot \left(\frac{\partial S}{\partial v}\right)_v - \left(\frac{\partial T}{\partial v}\right)_p \cdot \left(\frac{\partial S}{\partial p}\right)_v = 1$$

### 6<sup>th</sup> Relation:

Taking T & S as independent variable. i.e. x=T & y=S

We get,

$$\frac{\partial T}{\partial x} = 1, \frac{\partial S}{\partial y} = 1 \text{ \& } \frac{\partial T}{\partial y} = 0, \frac{\partial S}{\partial x} = 0$$

$$(vi) \Rightarrow \left(\frac{\partial p}{\partial T}\right)_S \cdot \left(\frac{\partial v}{\partial S}\right)_T - \left(\frac{\partial p}{\partial S}\right)_T \cdot \left(\frac{\partial v}{\partial T}\right)_S = 1$$

### Clausius – Clapeyron equation (1st latent heat equation)

From Maxwell's 1<sup>st</sup> relation we can write

$$\left(\frac{\partial S}{\partial v}\right)_T = \left(\frac{\partial P}{\partial t}\right)_v$$

$$\Rightarrow T \left(\frac{\partial S}{\partial v}\right)_T = T \left(\frac{\partial P}{\partial T}\right)_v \quad [\because dQ = TdS]$$

$$\Rightarrow \left(\frac{\partial Q}{\partial v}\right)_T = T \left(\frac{\partial P}{\partial T}\right)_v \quad \text{----- (i)}$$

Here,  $\left(\frac{\partial Q}{\partial v}\right)_T$  represents the quantity of heat absorbed per unit increase in volume at constant temperature. This quantity of heat absorbed at constant temperature is the latent heat (L),

Thus  $dQ = L$  &  $dV = V_2 - V_1$

$$\therefore \left(\frac{L}{V_2 - V_1}\right)_T = T \left(\frac{dp}{dT}\right)_V$$

$$\Rightarrow \left(\frac{dp}{dT}\right) = \frac{L}{T(V_2 - V_1)} \text{ which is the 1<sup>st</sup> latent heat equation.}$$

### Specific heat of constant volume $C_v$ :

The amount of heat required to raise the temperature of unit mass of a gas through  $1^\circ\text{C}$  when its volume keep constant, it is represented by  $C_v = \left(\frac{\Delta Q}{\Delta T}\right)_v$

**Specific heat of constant Pressure  $C_p$ :** The amount of heat required to raise the temperature of unit mass of a gas through  $1^\circ\text{C}$  when its pressure keep constant, it is represented by  $C_p = \left(\frac{\Delta Q}{\Delta T}\right)_p$

Show that  $C_p - C_v = R$

If  $V$  &  $T$  are chosen as the independent variables  $U = f(V, T)$  ----- (i)

Differentiating (i)

$$dU = \left(\frac{\partial U}{\partial T}\right)_V dT + \left(\frac{\partial U}{\partial V}\right)_T dV \text{ -----(ii)}$$

According to the 1<sup>st</sup> law of thermodynamics-

$$\begin{aligned} dQ &= dU + dW \\ &= dU + pdV \\ &= \left(\frac{\partial U}{\partial T}\right)_V dT + \left(\frac{\partial U}{\partial V}\right)_T dV + pdV \text{ -----(iii)} \end{aligned}$$

Dividing both side by  $dT$

$$\frac{dQ}{dT} = \left(\frac{\partial U}{\partial T}\right)_V + \left\{p + \left(\frac{\partial U}{\partial V}\right)_T\right\} \frac{dV}{dT} \text{ ----- (iv)}$$

If the gas is heated at constant volume-

$$\begin{aligned} \left(\frac{\partial Q}{\partial T}\right)_V &= C_V \quad \& \quad \frac{dV}{dT} = 0 \\ \left(\frac{\partial Q}{\partial T}\right)_V &= \left(\frac{\partial U}{\partial T}\right)_V = C_V \text{ ----- (v)} \end{aligned}$$

When the gas is heated at constant pressure,

$$\begin{aligned} \frac{dQ}{dT} &= C_p \\ \therefore C_p &= \left(\frac{\partial U}{\partial T}\right)_V + \left\{p + \left(\frac{\partial U}{\partial V}\right)_T\right\} \left(\frac{\partial V}{\partial T}\right)_p \end{aligned}$$

$$\therefore C_p = C_V + \left\{ p + \left( \frac{\partial U}{\partial V} \right)_T \right\} \left( \frac{\partial V}{\partial T} \right)_p$$

$$\text{But } \left( \frac{\partial U}{\partial V} \right)_T = 0$$

For ideal gas equation we can write

$$PV = RT$$

$$\Rightarrow P \left( \frac{\partial V}{\partial T} \right)_p = R$$

$$\therefore C_p - C_V = P \cdot \left( \frac{\partial V}{\partial T} \right)_p + \left( \frac{\partial U}{\partial V} \right)_T \cdot \left( \frac{\partial V}{\partial T} \right)_p$$

$$\Rightarrow C_p - C_V = R \quad (\text{Shown})$$

## Maxwell's law of Equipartition energy:

According to kinetic theory of gas we can write,

$$\frac{1}{2} mc^2 = \frac{3}{2} kT$$

But,  $c^2 = u^2 + v^2 + w^2$  as  $x, y, z$  are all equivalent. Mean square velocities along three axes are equal.

$$u^2 = v^2 = w^2$$

Hence,

$$u^2 = v^2 = w^2 = \frac{1}{3} c^2$$

$$\therefore \frac{1}{2} mu^2 = \frac{1}{2} mv^2 = \frac{1}{2} mw^2$$

$$\therefore \frac{1}{2} mc^2 = 3 \left( \frac{1}{2} mu^2 \right) = \left( \frac{1}{2} mv^2 \right) = \left( \frac{1}{2} mw^2 \right) = \frac{3}{2} kT$$

$$\Rightarrow 3 \left( \frac{1}{2} mu^2 \right) = \frac{3}{2} kT \quad \text{or, } \frac{1}{2} mu^2 = \frac{1}{2} kT$$

$$\Rightarrow 3 \left( \frac{1}{2} mv^2 \right) = \frac{3}{2} kT \quad \text{or, } \frac{1}{2} mv^2 = \frac{1}{2} kT$$

$$\Rightarrow 3 \left( \frac{1}{2} m w^2 \right) = \frac{3}{2} kT \quad \text{or, } \frac{1}{2} m w^2 = \frac{1}{2} kT$$

Thus, the average K.E. associated with each degree of freedom =  $\frac{1}{2} kT$
